

CLEANING OF ZnSe OPTICS AND MIRRORS

A.B.Esse presents a cleaning and maintenance kit for optics used on laser cutters.

This kit consists of a practical suitcase containing 9 different useful and necessary components for regular maintenance, both for focusing lenses and reflection mirrors. The chemical products (polish and the specific liquids) are of optimum quality and tailor-made for cleaning the above mentioned optics without damaging their fine coating. Acetone is useful for ordinary cleaning routines, Acetic Acid is needed for medium-severe cleaning approaches on the optics while Polish is meant for severe cleaning only (especially on mirrors), but the user must keep into mind that after a cleaning with Polish the lifetime of the optics is extended to just a few days of life more. Furthermore, enclosed to the kit there are clear and detailed instructions and advices. Two pairs of gloves, a little air pump with a brush, 100 cleaning papers for optics, cotton pads, and a bottle with a small spout complete this kit.
